Degradable is a natural and man-made product that can be broken down by natural processes into smaller parts. It must be exposed to sunlight or heat for extended periods of time to decompose. **Red lidded bin only.**

Biodegradable refers to a product breaking down into natural elements by organisms. These products can be made from a variety of materials: plastic, recycled plastic and plant, sometimes with an additive. There is no timeframe and it could take hundreds to thousands of years for it to biodegrade as there is no standard. **Red lidded bin only.**

Australian Standard Certified Compostable (AS 4736) is a product that will break down into natural elements, under a compost setting, made from plants and other organic materials. They break down much faster, many in roughly 90 days, and they also break down into nutrient-rich products, returning back to the environment. They must meet specific criteria in terms of time, environmental conditions and quality of compost produced. **Green lidded bin.**

Remember you don't have to use compostable liners in your kitchen caddy you can simply wrap it in newspaper or no need to line it at all just place it straight into your green lidded bin.

A certified
compostable liner?
YES

Newspaper?
YES

Nothing?
YES

Plastic, degradable &
biodegradable bags
NO

Let's all recycle our food and garden waste in our **green organics bins.**
